

## MPS Quick Reference

### MPS Operation Notes:

- The MPS system supports up to five removable power supply modules (one standby and four active modules).
- The system has a time delay at power-up. It may take three or four seconds for the system to start.
- A solid Green light indicates that the module is operating. A solid Red light indicates the module is failed. The Standby Indicator flashes Green/Red when not in use, and remains solid Green when it is in use.
- The Standby will be enabled when a module fails and remains enabled until the failed module is removed. Once removed, the operator has 16 seconds to insert a new module before the standby is disabled. However if there is only one active module in MPS 1 and a standby then the standby will remain enabled until a new module is inserted into MPS 1.

\* Picture shows an MPS-9 (9.2 volt version). This could also be (12) for the MPS-12 (12.0 volt version).
